

DIGITAL CERTIFICATES

TrustID | EV Code Signing | Organization Identity | Hardware Storage Certificate

TrustID | EV Code Signing | Organization Identity | Hardware Storage Certificate Benefits:

- Removes the “Unknown Publisher” warning
- Digitally signs unlimited number of software applications or executables
- Compatible with major platforms
- 24x7 Support

SECURE SOFTWARE CODE WITH TRUSTID | EV CODE SIGNING | ORGANIZATION IDENTITY | HARDWARE STORAGE CERTIFICATE

- **Establish trust with your customer** – Allows your customers to verify the organization name, locality and country of the user who has signed the code.
- **Reduce security warnings** – Avoids “Unknown Publisher” warning messages from browser and operating systems to establish trust in your organization as a software provider. The Extended Validation (EV) verification process significantly reduces the likelihood that these certificates are issued to fraudsters.

Security Challenges

As we continue our journey into the digital transformation era, a wide range of software programs such as firmware, drivers, desktop applications, mobile applications and application container images must be distributed and updated in a secure way to prevent tampering and forgery. Hackers are discovering new ways to use sophisticated malware attacks against government and private organizations. Security researchers have found that digitally signing code is an effective and common method to protect software programs. It ensures both data integrity to prove that the code was not compromised by hackers and source authentication to identify who was in control of the code at the time it was signed.

TrustID | EV Code Signing | Organization Identity | Hardware Storage Certificates

An IdenTrust TrustID | Extended Validation (EV) Code Signing certificate provides higher level of assurance for publisher’s identity as the organization must go through strict verification processes before receiving the certificate.

By default, TrustID | EV Code Signing | Organization Identity | Hardware Storage certificates are issued into FIPS 140-2 Level 2 compliant USB tokens requiring two-factor authentication to access the certificate in order to sign code.

CSR Enabled

Use of CSR (Certificate Signing Request) is supported during the EV Code Signing certificate application; once approved, the certificate can be installed in an applicant’s hardware security module (HSM) meeting standard security equivalent to FIPS 140-2 level 2 or Common Criteria EAL 4+. Enforcement of this requirement is handled via the Subscriber Agreement.

RFC 3161 Compliance

IdenTrust provides a free RFC 3161-compliant Timestamp Authority service that can be used for applying timestamp to any digitally signed code. It helps organizations reduce potential liability and provides long-term validation and non-repudiation of the time and date when the code was signed. Recipients can verify when the code was digitally signed as well as confirm that the code was not altered after timestamp.

The solution is designed to:

- Provide Extended Validation of software publisher based on CA/Browser Forum Requirements
- Instantly establish reputation with Microsoft® Smart Screen Application Reputation filter
- Store certificates on a FIPS 140-2 Level 2 compliant hardware USB token or HSM device to prevent certificate theft
- Allow certificates to be used in multiple ways such as firmware signing, driver signing, trusted application stores, application software signing
- Support certificates status for a minimum of 10 years after certificate revocation or expiration

Benefits include:

- Support of all major file formats including Microsoft Authenticode, Adobe® Air, Apple®, Java®, Mozilla® object files and Microsoft® Silverlight applications
- Self-services Certificate procurement through the IdenTrust website
- An offering for medium-to-large enterprises that provides custom approval workflow and HSM-based key storage
- Availability of TrustID | EV Code Signing | Organization Identity | Hardware Storage certificates to applicants from most countries except those with U.S. trade restrictions
- A timestamping service that allows an entity verifying code to accept the signature on the code as valid if the signing key was valid at the time the code was signed, even if the key has already expired at the time of verification, or if the key was compromised sometime after the code was signed.

SPECIFICATIONS

TrustID | EV Code Signing | Organization Identity | Hardware Storage Certificate

Supported Use Cases	<ul style="list-style-type: none"> • Software application or executable signing • Firmware signing • Mobile application signing • Browser add-on signing
Trust Model:	<ul style="list-style-type: none"> • Public • Private (e.g., firmware signing)
Validity Periods:	Available up to a three (3) year validity period
Information Displayed in Certificate	<ul style="list-style-type: none"> • Organization legal name • Organization business category • Organization jurisdiction or incorporation • Locality/State/Province and country • Organization registration number
Storage Type:	<ul style="list-style-type: none"> • IdenTrust FIPS 140-2 level 2 USB token, or • Customer HSM FIPS 140-2 level 2 or Common Criteria EAL 4+
Certificate Hash	<ul style="list-style-type: none"> • X509 v3 digital certificate with SHA-256 hash minimum 3072 or maximum 4096 RSA Keys
Timestamping CA Authority	<ul style="list-style-type: none"> • RFC 3161 compliant • Extends the longevity of signed code
Available to Non-U.S. Residents:	Yes – This certificate is available to applicants in a limited number of foreign countries, view our Supported Countries list
